

LA GRANDE PLATA PROJECT

- Situated 200km south of Filo Del Sol (BHP/Lundin paid US\$4B in 2024) same age rocks, similar geology.
- Discovery of old silver smelter just down the road adjacent to major highway (41).
- Width of veins and extent of alteration very encouraging with some target areas up to 100m wide (Calabozo)- Much wider than expected. Average 173g/t Ag, 1.3% Cu, 0.4g Au.
- Surrounded by Codelco and Fortescue . majors Barrick, Antofagasta, Codelco and Fortescue .
- Assays from Geological reconnaissance back with impressive results as 681g/t Ag, 0.7% Cu at Calabozo (outcrop) and 6.7% Cu, 600g/t Ag in a rock taken from San Jose historical pits, 3.3% Cu, 341g/t Ag from outcrop at Cumbre (with 217ppm Mo).
- Drilling program (1,550m) formulated by previous holders Rugby mining appears sound, is under review, with potential to add further drillholes.
- Most roads and pads (9) already built for Phase 1 (out of 39 permitted drill pads)- minor low cost road upgrades required.
- US\$1.5M budget 2026 to drill both projects with Diamond holes around 4,000M or more.

Google Earth photo showing lease boundaries, and select samples with high grade Cu, Au and Ag reported across a 7km strike length

FURANO PROJECT

- Located 3hrs from Iquique Airport, in the Tarapaca Region, Huara District. Average altitudes vary from 1,600 to 2,700m ASL (project around 2,200m)
- 85km NE thorough mainly paved roads from Iquique and 25km NW from Cerro Colorado – BHP mine (current 219 Mt @ 0.62% Copper oxides – 1860 Mt @ 0.34% Copper Sulfides).
- 27 Exploitation Licences, 9,000m of mostly shallow (<200m) drilling with hits such as 50m @ 1.2% Cu (from 110m, F15-17R) and 10m @ 2.4g/t Au from 40m (F15-18R)
